

Base station power supply part explanation

Overview

A stable and redundant power supply is crucial for uninterrupted base station operation. Traditional “integrated base stations” concentrated all processing and radio frequency (RF) units in an equipment room at the base of the tower, transmitting signals to the antenna on the tower top via long feeder cables. This architecture suffered from several critical weaknesses: 1. It includes: AC distribution box: Distributes mains power and offers surge protection. This equipment not only maintains service quality but also supports emergency response and safety protocols. Modern FPGAs and processors are built using advanced nanometer processes because they often perform calculations at fast speeds using low voltages (<0 . These components work together to transmit and receive signals, manage network traffic, and maintain continuous connectivity across vast geographical.
