

Princeton University s Microgrid

Overview

The Siemens Princeton Microgrid project was designed to address the challenges of decarbonization and distributed energy resilience. When Hurricane Sandy hit New Jersey in October 2012, Princeton's Cogeneration Plant microgrid was able to generate power for campus, while also maintaining steam and chilled. In October 2012, Princeton University made headlines worldwide when over 8 million electric customers lost power during Superstorm Sandy and the university's microgrid kept its critical systems running, allowing the New Jersey-based Ivy League campus to serve as an electric refuge for faculty. Princeton's microgrid—which became well known for riding through Superstorm Sandy more than 13 years ago—has been upgraded with heat pumps and a large thermal storage tank that has boosted efficiency and saved millions of dollars in utility costs. An example is the microgrid at Princeton University. The plant produces electricity as well as steam used for heat, hot water and sterilization.
