## Overview

With the increasing severity of environmental problems, many countries have set energy transition targets to promote the realization of the Paris Agreement. There has been a global consensus on utilizing solar energy. Climate change has become a challenge to the sustainable development of human. 1.1. Basic data and computing technologySolar radiation and geographic data are necessary parameters for conducting a solar energy resource assessment. In order to realize a digital This research combined geographic information processing, spatial analysis, big data calculation, and other technologies to complete the assessment of the global solar TRs, TPIC. Fig. 9 shows the distribution characteristics of the capacity factor of the global PV TPIC. It can be seen that the PV capacity factor of the centralized TPIC is mainly distributed in the range of 0. In this study, the global power plant database released by the World Resources Institute in 2018 was used to verify the rationality of the assessment results. This database off.
