

Solar panels provide electricity when there is light

Overview

A solar panel is a device that converts sunlight into electricity by using photovoltaic (PV) cells. PV cells are made of materials that produce excited electrons when exposed to light. These electrons flow through a circuit and produce direct current (DC) electricity, which can be used to power various devices or be stored in batteries. Solar panels are also. In 1839, the ability of some materials to create an electrical charge from light exposure was first observed by the French physicist. Though these initial solar panels were too inefficient for even simple elect. modules consist of a large number of solar cells and use light energy () from the Sun to generate electricity through the. Most modules use -based cells. Each module is rated by its output power under standard test conditions (STC) and hence the on field output power might vary. Power typically ranges from 100 to 365 (W). The efficiency of a module determines the a.
