

Solar thermal power generation collector

Overview

A solar thermal collector collects heat by absorbing sunlight. The term "solar collector" commonly refers to a device for solar hot water heating, but may refer to large power generating installations such as solar parabolic troughs and solar towers or non-water heating devices such as solar cookers or solar air heaters. Solar thermal collectors are either non-concentrating or concentrating. Flat-plate and evacuated-tube solar collectors are mainly used to collect heat for space heating, domestic hot water, or with an air collector. In contrast to solar hot water panels, they use a circulating fluid. A simple solar air collector consists of an absorber material, sometimes having a selective surface, to capture radiation from the sun and transfers this thermal energy to air via conduction heat transfer. This heated air is then used for space heating. Parabolic troughs, dishes and towers described in this section are used almost exclusively in or for research purposes. Parabolic troughs have been used for some commercial power generation.

Solar thermal power plant

Solar thermal power plants are electricity generation plants that utilize energy from the Sun to heat a fluid to a high temperature. This fluid then transfers its heat to water, which then becomes superheated steam. This steam is then used to turn turbines in a power plant, and this mechanical energy is converted into electricity by a generator. This type of generation is essentially the ...
